

EXERCISE AND SPORTS PROGRAMMING

ACADEMIC

Grade 11/12

Curriculum Guide

EXERCISE AND SPORTS PROGRAMMING

Pre-requisites:

Human Movement 1 (Basic Anatomy in Sports and Exercise), Human Movement 2 (Motor Skills Development)

Course Description:

The course is designed to provide learners with a comprehensive understanding of exercise programming and sports for fitness. It covers the principles of goal setting, training, functional movement, and periodization while promoting the development of personalized exercise programs aimed at improving their fitness. Learners will assess fitness and personal nutrition and actively participate in physical activities. At the end of the course, learners will also gain the skills needed to pursue certification and careers in fitness.

Elective: Academic

Time Allotment: 80 hours for one term

Content Standard:

- The learners demonstrate understanding of the principles of goal setting, training, functional movement, periodization, exercise program design, and the concepts, principles, techniques, methods, and assessments in fitness and sports-specific training programs to improve health, fitness, and performance.

Performance Standard:

- The learners design effective fitness and sports-specific training programs by applying principles and strategies to meet specific fitness goals and demonstrate them through various culminating activities.

LEARNING COMPETENCIES	CONTENT
<i>The learners...</i> 1. execute pre-participation screening and fitness testing;	Pre-participation Screening and Assessment • PAR Q & You • Functional Movement Screen Health and Skills Related Test
2. execute the different phases of training to ensure safe engagement in exercise;	Phases of Training • Warm-up Phase ◦ Stretching • Main Workout Phase ◦ Strength Training ◦ Endurance ◦ Conditioning • Cool-Down/Recovery Phase
3. apply the various principles of exercise training in relation to designing a fitness program;	Principles of Exercise Training • Adaptation, Individualization, Specificity • Overload, Progression, Reversibility • Variety, Rest, & Recovery
4. differentiate the three energy systems the body uses and how they are utilized in the various forms of exercise;	Energy System • Anaerobic (ATP-CP and Lactic Acid) • Aerobic Classification of Sports Based on Energy System Use
5. execute the various methods of training;	Methods of Training (Principles/Sports Requirements of Specific Sports) • Continuous, Interval, Fartlek, Circuit, Weight, Plyometric, Flexibility, & Resistance
6. analyze the importance of personal nutrition and hydration in relation to exercise and fitness;	Nutritional and Hydration Requirements for Exercise and fitness

LEARNING COMPETENCIES	CONTENT
	- Eating and Hydration Practices for Exercise and Fitness (Before, During, After Training and Competition) - FAD Diets
7. conduct a nutritional and hydration assessment using simple techniques or online applications;	Introduction to Nutritional Assessment - Importance of Nutritional Assessment - Technological Advances *Suggested Online Nutritional Assessment Applications: <i>Calorie Counter App, MyNetDiary App, and MyFitnessPal App</i> * Suggested Simple Techniques for Hydration Assessment: <i>Urine Color Chart and Body Weight Changes</i>
8. design a personalized exercise program tailored to fitness assessments, individual goals, and training principles to improve overall health, fitness, and sports readiness.	Establishing SMART Goals Utilizing FITT Developing Functional Movement - Body Composition - Cardiorespiratory Endurance - Muscular Strength and Endurance (Abdominal Stage Test, Skin Fold Test) Training Variables - Sets, Repetitions, Rest, & Load Culminating Activity for Exercise and Fitness <i>Suggested presentation of the Output (Personal)</i> Nutritional Requirements
9. explain the different components of periodization;	Individual, Dual, and Team Sports Exercise Programming Periodization Cycles Macrocycle

LEARNING COMPETENCIES	CONTENT
	• Preparation, Competition, Transition b. Mesocycle c. Microcycle Ordinary Training, Shock Training, Pre-Competition, Competitive, Rehabilitative
10. participate in culminating activities such as competitions and fitness festivals.	Training Program for Sports for Fitness
11. develop a training program for specific sports utilizing periodization principles and participates in culminating activities such as competitions and fitness festivals to apply the training.	Culminating Activity - Sports Skills Competition - Mini-Tournament - Fitness and Sports Festival (Presentation of Final Output) Use the GRASPS Model: Suggested output: <i>Portfolio, Short film, Vlog, Video</i>

GLOSSARY

Adaptation	Practicing frequently and consistently is important for improving performance.
Aerobic energy system	Provides energy for low-intensity physical activities that last from two minutes to a few hours.
Anaerobic Lactic	Known as the glycolytic energy system, an energy system that supplies energy for medium to high intensity physical activities.
ATP-CP	Is a dominant source of muscle energy for high-intensity physical activities.
Agility	The ability to change direction and position while maintaining control.
Balance	The ability to maintain your body's position while at rest or in motion.
Body composition	The ratio of fat compared to muscle and bone.
Cardiovascular endurance	The ability to efficiently take in oxygen and distribute it to the body.
Circuit training	Involves rotating through moderate-intensity exercises with little to no rest.
Conditioning	The main part of your exercise session
Continuous training	Is a form of exercise that is performed at a 'continuous' intensity throughout and doesn't involve any rest periods.
Cool-down	Brings your body back to a normal state after exercise
Coordination	The efficiency of movements as different parts of the body work together
Continuous training	Is a type of exercise that involves performing repetitive movements at a constant intensity without rest periods.
Energy System	A combination of physical and societal elements that convert energy resources into usable forms
Fartlek training	Is a kind of running training that involves random variations in speed and intensity, alternating between bursts of sprinting and slower 'recovery' jogging.
Flexibility	The range of motion around a given joint.
Flexibility training	Refers to the ability of muscles, joints, and soft tissues to move through an unrestricted, pain-free range of motion.
Fueling for performance	Is the act of eating specific foods or supplements during specific time windows to help maximize performance and support recovery in a certain activity.
Health-Related Fitness	Is characterized by moderate to vigorous physical activity. Health-related fitness activities can be integrated into everyday activities that are often characterized as lifetime activities.
Hydration	Replacing the body fluids lost through sweating, exhaling, and eliminating waste.
Individualization	Training programs should be customized to the specific needs and abilities of each individual.

Interval training	Is a training method that involves alternating periods of high and low-intensity exercise.
Load	A variable that refers to the amount of weight or resistance assigned to an exercise set and is considered a critical aspect of resistance training.
Macrocycles	These are the big-picture planning cycles. They typically span a longer period, such as a year, before a competition.
Mesocycles	These tend to be 4–6-week cycles within the macrocycle. For example, they typically involve 3 weeks of progressive-intensity training followed by a week of lower-intensity training.
Microcycle	These are short-duration cycles within the mesocycle. They tend to last a week. They can vary in intensity on the different training days of the week.
Muscular strength	The amount of force a particular muscle group can produce in one effort.
Muscular endurance	The ability to continuously use a particular muscle group against resistance.
Nutritional requirements	Are the levels of particular nutrients in the lowest amount that is necessary to maintain a person in good health.
Nutrition	Is the study of nutrients in food, how the body uses them, and the relationship between diet, health, and disease.
Overload	Work the body or a specific area with a greater workload than normal.
Periodization	Is the deliberate manipulation of training variables to optimize performance for competition, prevent overtraining, and progress performance.
Physical Activity Readiness Questionnaire (PAR-Q) and You-	is a self-screening tool that helps identify health conditions that could make exercise dangerous or difficult.
Physical Fitness	The ability of your body systems to work together efficiently to allow you to be healthy and perform activities of daily living.
Plyometric training	Also known as jump training, is a type of exercise that uses speed and force to build muscle power.
Power	The ability to exert force quickly or repeatedly.
Progression	Gradually increase the workload to continue improving.
Principles of Exercise Training	guidelines that help ensure effective training and positive results.
Reaction time	The ability to respond to a stimulus quickly.
Recovery	Allow enough time to recover between training sessions

Redesigning	Is to revise in appearance, function, or content.
Repetition	The number of repetitions you perform.
Rest period	The amount of time you rest between sets.
Resistance training	Increases muscle strength by making your muscles work against a weight or force.
Reversibility	Missing training sessions can set you back more than one week.
Sets	The number of repetitions you perform in a group.
Shock Training	is a method that uses the kinetic energy of falling weight which creates a compulsory muscle tension.
Specific Measurable, Achievable, Relevant Time-bound goals-Specificity	are a technique for setting objectives that are clear, achievable, and trackable.
Speed	Use specific practice to adapt the body to the desired goal.
Sports for Fitness	The rate at which someone can travel over a given distance.
	Refers to physical activities or games that individuals engage in to improve their overall health, strength, endurance, and well-being.
Skill-related fitness	Includes health-related components, but it also covers components related to physical performance.
Stretching	A physical exercise that involves elongating a muscle or muscle group to improve flexibility and range of motion.
Training Methods	The techniques and approaches used to improve skills and provide instruction in a specific area.
Training variables	Are the components of a workout routine that affect how quickly muscles are built.
Warm-up	Prepares your body for exercise
Weight training	Is a method of exercise that uses resistance to build strength, size, and endurance.
Variation	Change the intensity, volume, and time of workouts to prevent performance gains from stagnating.

PAR-Q & YOU

(A Questionnaire for People Aged 15 to 69)

Regular physical activity is fun and healthy, and increasingly more people are starting to become more active every day. Being more active is very safe for most people. However, some people should check with their doctor before they start becoming much more physically active.

If you are planning to become much more physically active than you are now, start by answering the seven questions in the box below. If you are between the ages of 15 and 69, the PAR-Q will tell you if you should check with your doctor before you start. If you are over 69 years of age, and you are not used to being very active, check with your doctor.

Common sense is your best guide when you answer these questions. Please read the questions carefully and answer each one honestly: check YES or NO.

YES	NO	
☒	☐	1. Has your doctor ever said that you have a heart condition and that you should only do physical activity recommended by a doctor?
☐	☐	2. Do you feel pain in your chest when you do physical activity?
☐	☐	3. In the past month, have you had chest pain when you were not doing physical activity?
☐	☐	4. Do you lose your balance because of dizziness or do you ever lose consciousness?
☐	☐	5. Do you have a bone or joint problem (for example, back, knee or hip) that could be made worse by a change in your physical activity?
☐	☐	6. Is your doctor currently prescribing drugs (for example, water pills) for your blood pressure or heart condition?
☐	☐	7. Do you know of any other reason why you should not do physical activity?

If
you
answered

YES to one or more questions

Talk with your doctor by phone or in person BEFORE you start becoming much more physically active or BEFORE you have a fitness appraisal. Tell your doctor about the PAR-Q and which questions you answered YES.

- You may be able to do any activity you want — as long as you start slowly and build up gradually. Or, you may need to restrict your activities to those which are safe for you. Talk with your doctor about the kinds of activities you wish to participate in and follow his/her advice.
- Find out which community programs are safe and helpful for you.

NO to all questions

If you answered NO honestly to all PAR-Q questions, you can be reasonably sure that you can:

- start becoming much more physically active — begin slowly and build up gradually. This is the safest and easiest way to go.
- take part in a fitness appraisal — this is an excellent way to determine your basic fitness so that you can plan the best way for you to live actively. It is also highly recommended that you have your blood pressure evaluated. If your reading is over 144/94, talk with your doctor before you start becoming much more physically active.

DELAY BECOMING MUCH MORE ACTIVE:

- if you are not feeling well because of a temporary illness such as a cold or a fever — wait until you feel better; or
- if you are or may be pregnant — talk to your doctor before you start becoming more active.

PLEASE NOTE: If your health changes so that you then answer YES to any of the above questions, tell your fitness or health professional. Ask whether you should change your physical activity plan.

Informed Use of the PAR-Q: The Canadian Society for Exercise Physiology, Health Canada, and their agents assume no liability for persons who undertake physical activity, and if in doubt after completing this questionnaire, consult your doctor prior to physical activity.

No changes permitted. You are encouraged to photocopy the PAR-Q but only if you use the entire form.

NOTE: If the PAR-Q is being given to a person before he or she participates in a physical activity program or a fitness appraisal, this section may be used for legal or administrative purposes.

"I have read, understood and completed this questionnaire. Any questions I had were answered to my full satisfaction."

Appendix D: Functional Movement Screen

1. DEEP SQUAT

The Deep Squat pattern challenges total body mechanics and neuromuscular control. We use it to test bilateral, symmetrical, functional mobility and stability of the hips, knees and ankles. The dowel overhead requires bilateral symmetrical mobility and stability of the shoulders, scapular region and the thoracic spine. The pelvis and core must establish stability and control throughout the entire movement to achieve the full pattern.

2. HURDLE STEP

The hurdle step pattern is an integral part of locomotion and acceleration. This movement challenges the body's step and stride mechanics, while testing stability and control in a single-leg stance. The hurdle step requires bilateral mobility and stability of the hips, knees and ankles. The test also challenges stability and control of the pelvis and core as it offers an opportunity to observe functional symmetry.

3. INLINE LUNGE

The Inline Lunge pattern places the body in a position to simulate stresses during rotation, deceleration and lateral movements. The inline lunge places the lower extremities in a split-stance while the upper extremities are in an opposite or reciprocal pattern. This replicates the natural counterbalance the upper and lower extremities use to complement each other, as it uniquely demands spine stabilization. This test also challenges hip, knee, ankle and foot mobility and stability.

4. SHOULDER MOBILITY

The Shoulder Mobility pattern demonstrates the natural complementary rhythm of the scapular-thoracic region, thoracic spine and rib cage during reciprocal upper-extremity shoulder movements. This pattern also observes bilateral shoulder range of motion, combining extension, internal rotation and adduction in one extremity, and flexion, external rotation and abduction of the other.

5. ACTIVE STRAIGHT-LEG RAISE

The Active Straight-Leg Raise pattern not only identifies the active mobility of the flexed hip, but looks at the core stability within the pattern, as well as the available hip extension of the alternate hip. This is not so much a test of hip flexion on one side, as it is an appraisal of the ability to separate the lower extremities in an unloaded position. This pattern also challenges the ability to dissociate the lower extremities while maintaining stability in the pelvis and core.

6. TRUNK STABILITY PUSH UP

The Trunk Stability Push-Up pattern is used as a basic observation of reflex core stabilization, and is not a test or measure of upper body strength. The goal is to initiate movement with the upper extremities in a push up pattern without allowing movement in the spine or hips. The movement tests the ability to stabilize the spine in the sagittal plane during the closed kinetic chain, upper body symmetrical movement.

7. ROTARY STABILITY

The Rotary Stability pattern is complex, requiring proper neuromuscular coordination and energy transfer through the torso. This pattern observes multi-plane pelvis, core and shoulder girdle stability during a combined upper and lower extremity movement. The movement demonstrates reflex stabilization and weight shifting in the transverse plane, and it represents the coordinated efforts of mobility and stability observed in fundamental climbing patterns.

Scoring Criteria

The FMS uses a simplistic grading system. Each individual movement pattern has certain criteria that must be accomplished in order to obtain a high score. The scoring is broken down into four basic criteria:

3

Three is given if the individual can perform the movement without any compensations according to the established criteria

2

Two is given if the individual can perform the movement but must utilize poor mechanics and compensatory patterns to accomplish the movement

1

One is given if the individual cannot perform the movement pattern even with compensations

0

Zero is given if the individual has pain during any part of the movement

TOTAL			

Raw Score: This score is used to denote right and left side scoring. The right and left sides are scored in five of the seven tests and both are documented in this space.

Final Score: This score is used to denote the overall score for the test. The lowest score for the raw score (each side) is carried over to give a final score for the test. A person who scores a three on the right and a two on the left would receive a final score of two. The final score is then summarized and used as a total score.
